Online Food Redistribution

The project entitled "Online food Redistribution" has been developed to reduce food wastage and poverty. This project is used to manage wastage foods in a useful way. Every day the people are wasting lots of foods. So we have to reduce that food wastage problem through online. It is a mission to end food wastage and hunger to make the 'world hunger free'. We recover surplus food from weddings parties and functions and donate it to needy and hunger people.

The 'online food redistribution' has been mainly used to manage balance food in a useful way. If anyone has extra food because of any events or in hotels it will become waste, because instantly there is no way to share food with anyone if they having lots of food, else if they want to give that extra food to any orphanage or poor people they don't have time. So we are introducing an application for sponsoring of extra food to poor people, nearby orphanage, old age homes, hospitals etc. Whenever they are having wastage food, the donator can enter their details and give request to the admin. They will enter the food quantity details and address in that

application and the admin will maintain the details of food donator. Admin maintain the receiver's details too (orphanage, poor people, old age homes...). whenever donors ready to donate food, availability of food will be notified to the receivers. The receiver can give approval to the donors. volunteers will help in managing donors and receivers. They will login and verify donors and receiver. This system also provides online feedback from users. This project is mainly focused on food redistribution which is an enormously successful social innovation that tackles food waste and food poverty. This will be a greater secure wing for the emergency criteria's mainly happens due to disaster.

The project is mainly focused on food redistribution which is an enormously successful social innovation that tackles food waste and food poverty. This will be a greater secure wing for the emergency criteria's and we recover surplus food from wedding, parties and functions and donate it to needy and hungry people. Our mission is to address this challenge by offering an innovative solution to reduce food waste and help people in need.

If anyone have extra food because of any function or in their home or in hotels it will become waste because instantly there is no way to share the food with anyone even if they want to give that extra food to any orphanage or poor people they don't have time. So that we create an application for Sponser that extra food to poor People or nearby orphanage. Commencement of my Project was done with an objective of developing an application which reduces the Food waste and helps to make the World Hunger free.

In the present System the human beings are not very much concentrated in helping others by giving the food items to people who are not having any way to buy. So for helping those kind of people, now there are some older applications or criteria's to inform the People who are interested in giving up the Food. But the application doesn't provide an efficient method by assigning the duties over certain volunteers in societies. The system is not providing any accurate information concerned authorities. It is not user friendly. It consumes lots of time of users.

This Project is mainly focused on food redistribution which is an successful social innovation. The admin will collect details of food from donator through application and then provide to nearest Orphanages or poor people who are registered. We can regularly verify the updations by the admin. This will be a support and secure wing for the emergency criteria's mainly happens due to disasters. Also it helps in the Sponsoring of Funds.
